

MUD Defender Dashboard Top Rail Fitting Guide (Vinyl Trimmed Version)

The MUD dashboard top rail is suitable for both left-hand drive or right-hand drive layouts. The passenger side of the dashboard rail will tuck within the grab-handle and the opposite end will tuck inside the heater control plastic trim on the driver's side.

The end of the dashboard rail that tucks under the heater control on the end of the binnacle will need the layer of vinyl trimming back prior to installation to allow the plastic trim to sit neatly over the end of the dashboard rail.

Make a cut line with a sharp bladed knife and peel away the vinyl from the **drivers side** end of the dashboard-rail. Ignore the threaded insert on the drivers side. This is only used for the grab-handle fixing on the passenger side.

Drill through the holes in plastic end trim into the top rail with a 3mm drill to create the 2 x fixing holes (top & side) that secure the heater control end trim into the dashboard-rail.
