Product information about mummified moss

Mummification / preservation of plants has existed for many years and the method in which our moss is preserved is patented.

The preservative liquid that is used consists of 100% natural plant substances, which are biodegradable and harmless to humans and surroundings. The liquid in the moss is replaced with the preservative liquid. Afterwards the moss is dried over a long period of time. This process causes the moss to become form and colour resistant and leaves no odour nuisances.

Our moss is prepared in the Netherlands and is produced according to a protected growth process.

Care, maintenance and usage

Avoid pressing the moss.

Avoid direct or prolonged exposure to sunlight.

Avoid prolonged exposure to excessive humidity (above 80%).

For indoor use only.

Do not spray or add water.

Can be dusted gently.

Special characteristics

Our moss does not attract insects.

No occurrence of fungal spores.

Our moss does not need water.

The moss does not affect the indoor climate negatively.

The moss has a positive impact on acoustics.
